methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ idea: hide additional information in the audio data stream
- ▶ motivation:
 - ▶ for copyright management
 - ▶ to proof that an audio signal has not been modified
 - ▶ to label the originator
 - ▶ to monitor the usage by television or radio
- ▶ watermarking techniques are in use today but no details are published

audio watermarking: requirements

audio watermarking: requirements

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

audio quality, transparency should not affect audio quality, ideal: not audible (= totally transparent)

capacity high information density of the watermark

robustness not easily detectable for an attacker and insensitive regarding manipulations. Ideal: watermark information remains conserved as long as audio material is of any use.

reliability watermark shall be detectable with high reliability

above requirements can't be maximized all together → depending on application an optimum has to be found.

audio watermarking: time domain methods

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

time domain methods: superposition of 'noise'

time domain methods: superposition of 'noise'

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ strategy: add suitably modulated signal
 - ▶ low level
 - ▶ "noise-like character"
- ▶ detection process: evaluation of correlation between signal and modulation pattern
- ▶ relatively robust, low information density

introduction

methods

time domain methods

frequency domain methods

robustness tests

back

time domain methods: modulation of the LSB

time domain methods: modulation of the LSB

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ modifying the least significant bit in each sample
 - ▶ very high information density
 - ▶ noise floor is increased by 6 dB
 - ▶ extremely sensitive to signal manipulations

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

time domain methods: addition of 'echoes'

time domain methods: addition von 'echoes'

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ make usage of precedence effect of the ear:
 - ▶ echo with short delay re. direct sound is inaudible
- ▶ level of artificially added echo typically 20...40 dB below original signal
- ▶ watermark information coded as echo delay (e.g.: 10 ms \mapsto 0, 30 ms \mapsto 1)
- ▶ detection by evaluation of autocorrelation function
- ▶ method is robust and transparent but information density is low

introduction

methods

time domain methods

frequency domain methods

robustness tests

back

frequency domain methods: modification of phase

frequency domain methods: modification of phase

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ make usage of inaudibility of signal phase:
 - ▶ block-wise FFT
 - ▶ modification of phase according to watermark information
 - ▶ inverse FFT
- ▶ high information density but easily destroyable

frequency domain methods: addition of a modulated tone

frequency domain methods: addition of a modulated tone

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ make usage of frequency masking of the ear:
 - ▶ addition of tones with level below the shifted hearing threshold
 - ▶ coding scheme: $f_1 \mapsto 0$, $f_2 \mapsto 1$

frequency domain methods: suppression of frequency bands (notch filter)

frequency domain methods: suppression of frequency bands (notch filter)

introduction

requirements

methods

time domain methods

frequency domain methods

robustness tests

back

- ▶ make usage of the limited frequency resolution of the ear:
 - ▶ coding process: attenuation of a small frequency band of the audio signal
 - ▶ implementation by block-wise FFT, removal of a few lines, inverse FFT
- ▶ high transparency, relatively low information density, easily detectable

robustness tests of audio watermarks
